Zephyr™

Towards an Industry-Standard EC

Zephyr Developer Conference 2022
Simon Glass, Google LLC

What is an EC?

- "Embedded Controller" for laptop
- Just a microcontroller
 - Often ARM, with RISC-V appearing also
 - Around 120 pins
- Designed for controlling a laptop / PC
- May have some special features

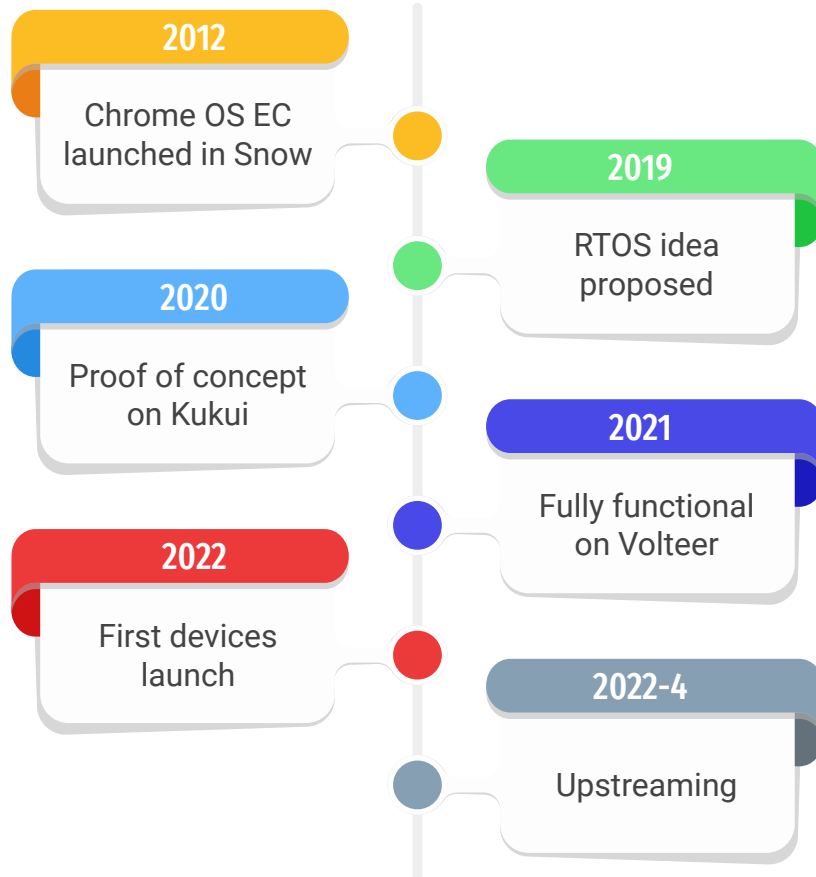

EC is critical to laptop function

Common functions

Some history, and the move to Zephyr

Why have an industry-standard EC implementation?

- Unified code base for Chrome OS, Windows
 - Chip vendors write a driver once
 - Shared test investment
 - Expands market for EC vendors
 - Allows OEMs to second-source EC parts more easily
 - OEMs/ODMs can focus on innovation
-
- Collaborate around a single RTOS (Zephyr)

Zephyr community advantages

- Infrastructure including code base, issue tracker, Discord
- Very active engagement among participants
- The project can make decisions (TSC, etc.)
- Zephyr OS is technically attractive

Vision for EC on Zephyr

- Enable EC functionality by selecting a Kconfig
- Support EC functionality on any suitable microcontroller
- Full suite of native_posix emulator-based tests for CI
- 90% code coverage
- Support vendor-specific EC functionality in closed-source app

Next steps

- Attend the technical talks today from these Googlers:
 - 11:50 Using Zephyr for Embedded Controllers Keith Short
 - ??:?? Create a USB-C Sink Device with Zephyr Samuel Hurst
- Watch the virtual sessions today:
 - 05:40 Android's CHRE and OS Frameworks Yuval Peress
 - 14:15 Zephyr Unit Tests and Emulators at Google Yuval Peress
- Thursday virtual:
 - 14:50 USB-C Power Delivery Overview Diana Zigterman
- Collaborate on Zephyr EC: designs, issues, PRs
- Connect with us to see how you can get involved
